

Walking along the Physics Laboratory:

What is Electricity? The Hydrogen, Fuel of the Future

Storing the surplus energy by means of the production of HYDROGEN (high energy carrier), it can become the fuel of the future by combining itself with the O2 in the air of the Fuel Charger obtaining electricity and H2O

The experiences shown here allow us to discover what Electricity is and how to produce it without altering the environment, what Hydrogen is and why it may be the Fuel of the Future. Based on the concept of charging, the electric and magnetic field, we explain what "elegance" electricity is produced with and how it can be generated by the so-called Renewable Energies, helping "all" in its production.
